COURSE DESCRIPTION

This course is an introduction to the geological setting of selected U.S. National Parks. It provides an overview of geological concepts using the Parks as examples and relates the geology to cultural aspects of these parks and environmental issues.

COURSE GOALS AND OBJECTIVES

This course provides an overview of the geology of select American National Parks and adjacent regions in the context of geodynamic and geomorphologic processes. The National Parks display dramatic landscapes and geological features in nearly every of plate tectonic setting.

We will use the geology of the Parks to better understand the materials the make up the Earth's crust and the integrated Earth systems involved in forming and modifying landscapes in the surface environment. The Earth systems include interactions between the dynamics of the solid Earth (lithosphere), surface water and ground water (hydrosphere), climate and weather (atmosphere), and life form (biosphere).

The geology of the National Parks will be related to cultural aspects and environmental issues. We will also study geological hazards including volcanic eruptions, earthquakes, and landslides that pertain to the various parks and adjacent regions.

When you complete this course will be able to identify geologic features of the American national parks, explain the plate tectonic forces and surface processes that combine to create unique landscapes, analyze data to develop hypotheses about the development of geological elements and predict future conditions in area within and around the Parks, and evaluate the role of humans in preserving, utilizing and modifying the geology of the Parks. This course will cover the following parks:

- Grand Canyon National Park
- Zion National Park
- Bryce Canyon National Park
- Arches National Park
- Canyonlands National Park
- Mesa Verde National Park
- Death Valley National Park
- Grand Teton National Park
